### Problem Statement:

The CDC has recently issued a statement saying that it recommended that people wear two masks in order to help prevent the spread of the new strains of COVID-19, they specifically recommended wearing a cloth mask over a surgical one. Thus we want to make it easier for mask wear to have the protection of both all in one adequate mask.

### Idea:

We will make a multi-layered masking using fabrics such as cotton quilting fabric and polypropylene in order to design a mask that will fit the proper criteria.

Design #1	2	4	5	4	5	20
Design #2	3	3	5	3	5	19
Design#3	4	3	5	2	3	17

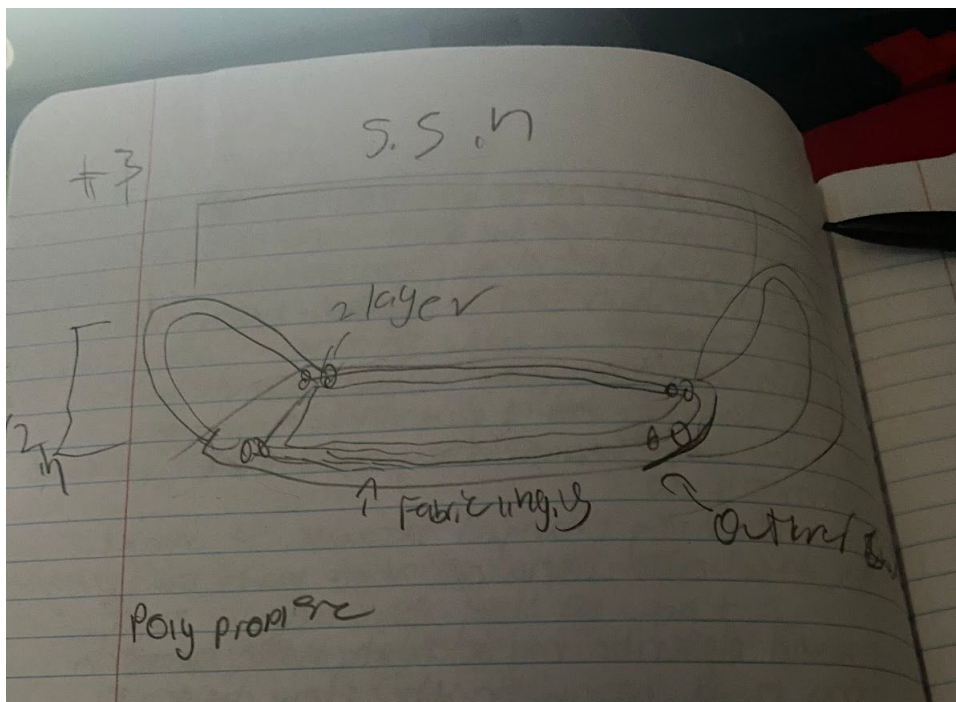

Materials to note: tightly woven cotton fabric (quilting fabric or cotton sheets.)  
Best overall material to note: polypropylene

Use all 3 layers of fabric in one

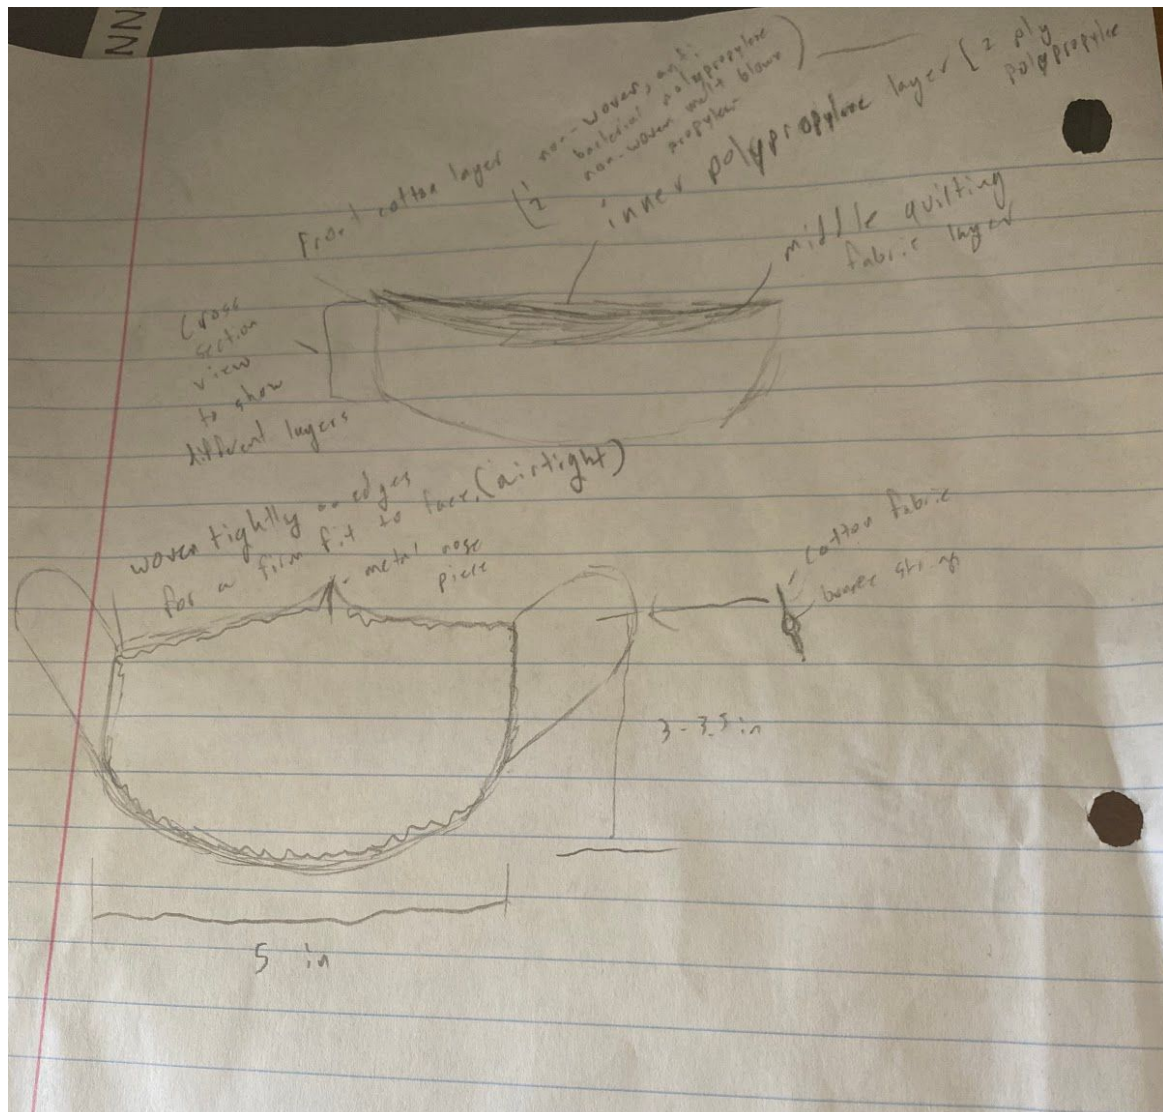

Things to test for:  
Airflow for being able to breath properly  
Overall effectiveness  
Airtight fit?

### Mask final design notes:

- Removed the inner cotton layer since it's unnecessary and could potentially make it hard to breath
- Removed filter pocket because that could cause a lot of unnecessary waste and it's better to just clean the mask
- Aiming to make it reusable since disposable masks don't mean decomposable so it could be harmful to the environment.
- Tightly woven around edges to secure to face and be airtight
- Cotton fabric string with bungee or elastic string inside to make it adjustable and not hinder comfort
- Have the polypropylene layer be the innermost part
- Only 3 layers to make it so those with asthma wouldn't potentially have trouble breathing
- Scrapped the shareability idea since that's just not a good idea especially with a mask of this grade
- Inner polypropylene layer consists of the first and third layers used in a surgical mask
- Melt-blown layer as second ply of polypropylene with an anti-bacterial layer
- Polypropylene layers should be non-woven for best results
